Auto Ticket classification using FLOW DESIGNER

SCENARIO

Raising, auto-classifying, routing, and resolving a support ticket using Flow Designer

Entice
How does someone initially become aware of this process?

Enter
What do people experience as they begin the process?

Engage
In the core moments in the process, what happens?

Exit
What do people typically experience as the process finishes?

Extend
What happens after the experience is over?

Steps
What does the person (or group) typically experience?

Entice	Enter	Engage	Exit	Extend
Ticket volume grows Support teams receive more tickets every day from email, portal, and chat	**Open Flow Designer** The admin opens Flow Designer from the Process Automation menu and creates a new flow	**User submits a ticket** An employee raises an incident from the portal, email, or chat with a short description	**Agent receives ticket** The agent sees the ticket already classified in their queue and starts work	**Review flow executions** The admin checks the execution logs to see which tickets the flow handled
Manual triage delays Agents spend time reading each ticket and choosing the category and priority by hand	**Set the trigger** They choose a trigger such as Incident Created so the flow starts for every new ticket	**Flow classifies ticket** The flow starts, reads the keywords, and sets the category, priority, and group	**Agent verifies** The agent checks the category and priority and corrects them if they are wrong	**Refine the rules** Keywords and conditions are updated based on misclassified tickets
Look for automation The admin explores ways to automate ticket triage without writing complex code	**Add classification logic** They add conditions on the short description and keywords to decide category and priority	**Ticket is routed** The ticket lands in the right team's queue and the requester is notified	**Ticket is resolved** The agent resolves the ticket and the requester gets a closure notification	**Measure accuracy** Reports show how many tickets were classified correctly and how much time was saved
Discover Flow Designer The admin finds that Flow Designer offers a low-code way to build workflows	**Assign the group** The flow updates the category, priority, and assignment group using an Update Record action			**Expand automation** The team reuses the flow for other request types or adds predictive intelligence
Review a use case The admin reviews how a flow can classify and route tickets as soon as they are created	**Test and activate** They run a test with a sample ticket, then activate the flow to publish it			

Interactions
What interactions do they have at each step along the way?

- **People:** Who do they see or talk to?
- **Places:** Where are they?
- **Things:** What digital touchpoints or physical objects would they use?

Entice	Enter	Engage	Exit	Extend
Incident list and reports on the ServiceNow platform	Flow Designer home page on the ServiceNow instance	Service portal, email, or chat where the employee raises the ticket	Agent's incident list or workspace on the ServiceNow platform	Executions list in Flow Designer
Service desk team meeting or daily stand-up	Trigger panel within the Flow Designer canvas	Flow Designer runs the flow automatically on the ServiceNow platform	Incident form fields (category, priority, assignment group)	Flow Designer editor to change conditions and publish again
Discussion with the platform admin or team lead	If / Else conditions and data pills within Flow Designer	Assignment group queue in the agent's incident list or workspace	Email or portal notification sent to the requester	Reports and dashboards on the ServiceNow platform
Flow Designer under Process Automation on the ServiceNow instance	Update Record action within Flow Designer	The employee only sees a ticket confirmation; the flow runs quietly in the background.	The agent may talk with the requester to clarify the issue.	The admin may also ask agents for feedback on wrong classifications.
Product documentation, community posts, and training videos	Test panel and Activate button in Flow Designer	The requester receives an email or portal update when the ticket is assigned	The requester can reopen the ticket or comment if the issue is not fixed.	Flow Designer and other ServiceNow tables such as requests and changes
The admin may also talk to teammates who already use flows.		Flow execution details can be viewed by the admin in Flow Designer.	Some tickets are reassigned by the agent to another group.	

Goals & motivations
At each step, what is a person's primary goal or motivation? ("Help me..." or "Help me avoid...")

Entice	Enter	Engage	Exit	Extend
Help me reduce the time spent sorting tickets	Help me start a new flow without getting lost	Help me report my issue quickly and get it sorted	Help me start work with all the ticket details ready	Help me see what the flow has done
Help me avoid wrong categories and misrouted tickets	Help me pick the right trigger for every new ticket	Help me get the right category and priority without manual work	Help me know that my issue is resolved	Help me fix wrong classifications quickly
Help me find a simple way to automate this work	Help me define clear rules that classify tickets correctly	Help me get my ticket to the right team fast		Help me apply this success to other processes
Help me understand what Flow Designer can do	Help me send each ticket to the right team			
Help me see if this fits our ticket process	Help me feel confident that the flow works before going live			

Positive moments
What steps does a typical person find enjoyable, productive, fun, motivating, delightful, or exciting?

Entice	Enter	Engage	Exit	Extend
Low-code, drag-and-drop design looks easy to learn	The drag-and-drop canvas is easy to understand	Classification happens within seconds of ticket creation	Agents feel relieved when tickets arrive already sorted	Execution logs make it easy to trace each ticket
Ready-made triggers and actions save build time	The trigger list is simple and clear	Tickets reach the right group faster, with fewer hand-offs		Teams are pleased to see faster response times
Teams like the idea of tickets reaching the right group faster	The test panel shows results step by step			

Negative moments
What steps does a typical person find frustrating, confusing, angering, costly, or time-consuming?

Entice	Enter	Engage	Exit	Extend
Admins are unsure how to begin without prior flow experience	Hesitation about the build ("Will this classify tickets correctly?")	Employees sometimes write vague descriptions, so keywords are hard to match	Agents are unsure whether the flow's classification is always correct	
Several people feel unsure which trigger and conditions to use		Some tickets match more than one category and get classified incorrectly	Agents report extra effort when they have to reclassify tickets	
People worry that wrong classification could affect customers			Sometimes an issue returns after the ticket is closed	
			Wrong classifications need manual fixes and reassignment	
			There is no easy way for agents to flag flow mistakes	

Areas of opportunity
How might we make each step better? What ideas do we have? What have others suggested?

Entice	Enter	Engage	Exit	Extend
How might we provide a short guide with the first steps for a new admin?		How might we guide the requester to add clearer details when raising a ticket?	How might we let agents flag a wrong classification with one click?	How might we alert admins automatically when a flow fails?
Could we offer ready-made classification flow templates?			Could we add a confidence check so unclear tickets go to a triage queue?	How might we suggest new keywords from misclassified tickets?
Make it easier to compare and pick the right trigger without deep reading			How might we show the reason the flow chose a category?	
Provide a simple checklist of what to prepare (categories, groups, keywords)			Could we ask the agent to confirm the category when resolving?	
Show demo videos or sample results of real classified tickets?			How might we ask the requester for quick feedback on the resolution?
