Project Design Phase
Proposed Solution Template

Date	29 September 2026
Team ID	SWTID-2026-3564
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Proposed Solution Template:

Project team shall fill the following information in the proposed solution template.

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	IT service desks receive a large number of incidents every day, and agents classify and route each one by hand. Users often choose wrong categories or write unclear descriptions, so tickets are misrouted, bounce between groups, and miss their SLAs. The problem is the lack of a consistent, automatic way to classify tickets and assign them to the right group.
2.	Idea / Solution description	A ServiceNow Flow Designer flow that runs when an incident is created or updated. Using low-code conditions and keyword lookups on the short description and description, it sets the category, subcategory, priority and assignment group. It adds a work note explaining the classification and notifies the assigned group. Tickets that match no rule go to a manual triage queue.
3.	Novelty / Uniqueness	Fully low-code: the logic is built visually in Flow Designer with no heavy scripting or extra AI licence. Keyword-to-category mapping is kept in an editable lookup table, so admins can change routing without touching the flow. A safe fallback queue means no ticket is lost when the rules do not match.
4.	Social Impact / Customer Satisfaction	Users get faster responses and resolutions because tickets reach the right team immediately. Agents spend less time on repetitive triage and more on solving problems, which reduces stress and improves job satisfaction.

		Better SLA compliance builds trust between IT and the business.
5.	Business Model (Revenue Model)	Delivered as a reusable ServiceNow automation package for IT service desks. Possible revenue: one-time implementation and configuration fee, annual support and rule-tuning subscription, and paid customisation of category rules for each client's industry.
6.	Scalability of the Solution	The flow uses standard ServiceNow features, so it scales with the instance and handles rising ticket volume without extra staff. New categories, keywords and groups are added through the lookup table, and the same design can be extended to requests, changes and other departments such as HR and facilities.
